

I made three folders to organize my GitHub:

Drafts

Whenever a draft of a module is required, this is an individual file.

Explanations

If the module isn't self-explanatory, one of these are required as a file.

Modules

All projects, whether they contain explanations or not, that fit in a single file and aren't broken up into parts. It also serves as a catch-all for image files that are part of a module, so that some part of each module can be accounted for in the same folder.

My files already had names that made them clearly fit in one of the three folders I listed, so I didn't have to rename any to make them fit my new organization system. I then had to redo the links with the /house/folder/ tags so that GitHub could find them again. As the class increases focus on our final portfolios, I imagine I'll add a portfolio folder for files pertaining to that assignment, and if the image content begins to form enough of its own section, a folder for that as well.
